**Yellow Giant Hyssop**  
*Agastache nepetoides*  
ag-ah-STA-kee nep-eh-TOY-deez

NC native perennial

cold stratify & spring  
sow or sow in fall

blooms in summer &  
in the second year

prefers part shade but  
will tolerate full sun

likes rich, loamy soil;  
resents consistent  
dryness

hummingbird & pollinator  
favorite; resists deer

## Growing Instructions

To direct sow in the fall, press into the surface of the soil. For spring planting, mix the seed with moist sand and store it in the refrigerator for 60 days before pressing onto the soil surface. Germination should take a week. Medium to moist soil is best for this plant, but as it matures it becomes somewhat drought tolerant. Plant blooms from seed in its second year and reseeds itself readily.

## Garden like it's 1776!

A little colonial plant lore for the nation's 250<sup>th</sup> birth year

### Botanical Illustration, 1781 by Nikolaus Jacquin

Indigenous Peoples first introduced yellow giant hyssop to colonists as a remedy for treating poison ivy rash, but it gained horticultural interest for its attractiveness to bees in both wild and cultivated settings. Compared to its licorice-scented and lavender-flowered relative, the anise hyssop (*Agastache foeniculum*), giant yellow hyssop (*Agastache nepetoides*) is much more subtly colored and scented. However its long flowering periods and abundant production of nectar make it highly attractive to bees. This trait gained it a subtle appreciation in gardens and among beekeepers. By the late 1800s its cultivation had become widespread in the Midwest and Southeast.
